

InterviAI Interview Report

Role: Data Analyst intern

Difficulty: Easy

Overall Score: 6.2

Recommendation: Borderline

Scores

Technical: 7.5

Communication: 5.0

Confidence: 7.0

Problem Solving: 5.5

Strengths

- Flawless and accurate execution of SQL and Pandas syntax for data grouping and aggregation.
- Solid understanding of standard data cleaning and imputation strategies for missing values.
- Highly structured and objective approach to teamwork, conflict resolution, and leadership.
- Strong technical pedigree in Computer Science with exposure to advanced AI and OS concepts.

Weaknesses

- Struggles to translate technical metrics like Precision and Recall into coherent, non-technical analogies.
- Demonstrated highly reactive, non-analytical business logic when addressing a sudden drop in sales.
- Lacks depth when describing the data analysis methodologies used in previous academic projects.

Highlights

- Perfectly answered the technical SQL and Pandas aggregation question.
- Articulated a mature, structured approach to resolving team disagreements by focusing on objective project requirements.

Concerns

- The recommendation to launch a 30% discount instead of investigating the root cause of a 30% sales drop is a major analytical red flag.
- Inability to map precision and recall to everyday situations indicates difficulty presenting to non-technical business units.

Technical Evidence

- Correctly written SQL query utilizing GROUP BY and SUM().
- Proper implementation of Pandas aggregation using df.groupby() combined with .sum().
- Suggested median imputation for financial datasets and proposed conditional row deletion based on missingness percentage.

Learning Roadmap

- Practice structured root-cause analysis frameworks to systematically diagnose business metric drops before proposing solutions.
- Refine communication skills by explaining complex algorithms and statistics to non-technical peers using validated industry analogies.
- Incorporate Exploratory Data Analysis (EDA) protocols to understand the distributions and patterns of missing data rather than applying quick fixes.
- Prepare a detailed breakdown of the exact statistical and analytical methods used in your research projects to present them more robustly.

Competency Report

Technical Skills

Level: Strong

Demonstrated precise SQL and Pandas capabilities, showing immediate readiness for basic querying and data manipulation tasks.

Communication

Level: Weak

Unable to effectively convey technical concepts to business stakeholders, providing a confusing and inaccurate fishing net analogy.

Problem Solving

Level: Average

Understood data cleaning trade-offs well, but failed to apply rigorous root-cause analysis when faced with a business metrics anomaly.

Behavioral & Leadership

Level: Strong

Showed excellent structured leadership qualities, prioritizing team consensus, clear delegation, and objective project mapping.

Overall Feedback

The candidate has strong technical foundations, demonstrating accurate SQL, Pandas, and data cleaning knowledge. Their behavioral responses paint the picture of an organized team player who can take on leadership and resolve conflicts structurally. However, they currently struggle to shift from an engineering mindset to an analytical business mindset. They failed to construct a logical non-technical analogy for precision/recall and made a major logical error by suggesting a reactive sales campaign over diagnosing an actual system drop. For a Data Analyst intern, they have raw technical capabilities but require significant guidance on business intuition and stakeholder management.
