

InterviAI Interview Report

AI-powered mock interview assessment

CANDIDATE

hasan arsalan

hasanarsalan781@gmail.com

ROLE

**Backend
Developer**

DIFFICULTY

Easy

DATE

**September 03,
2026**

RECOMMENDATION

No Hire

Scores

2.0 OVERALL	3.0 TECHNICAL	2.0 COMMUNICATION	1.0 CONFIDENCE	2.0 PROBLEM SOLVING
-----------------------	-------------------------	-----------------------------	--------------------------	-------------------------------

Strengths

- Demonstrated a clear understanding of Python mutability and immutability (lists vs. tuples).
- Understood the basic physical memory layout differences between Arrays (contiguous) and Linked Lists (pointers).
- Correctly identified how a foreign key maps to a primary key in another table and the purpose of ON DELETE CASCADE.

Weaknesses

- Lacks basic knowledge of SQL operations, including the difference between INNER and LEFT JOINs.
- Exhibited fundamental gaps in Big-O time complexity analysis for common data structures (Hash Maps, Arrays, Linked Lists).
- Showed very low professional resilience and interview stamina, choosing to terminate the interview abruptly when faced with difficulty.
- Failed to explain the SQL constraint rules regarding Unique keys accepting NULL values in MySQL.
- Struggled to articulate the database schema design and entity relationships of his own portfolio projects.

Highlights

- Accurately described Python list and tuple mutability differences and provided a valid use case for each.

Concerns

- The candidate abruptly requested to end the interview ('Let's end the interview') when asked a technical question he did not know, showing a severe lack of professional resilience, adaptability, and coping mechanisms under pressure.
- Critical knowledge gaps in core relational database concepts (joins, constraints) which are fundamental for a backend developer.
- Lack of foundational algorithm analysis skills (Big-O notation).

Technical Evidence

- Explained that Python lists are mutable while tuples are immutable, and suggested using tuples for values like dates.
- Correctly defined a dictionary as storing data in key-value pairs.
- Explained that arrays store data in contiguous memory while linked lists use pointers to reference the next element.
- Incorrectly asserted that a column with a unique key constraint cannot accept NULL values in MySQL.
- Failed to explain the difference between an INNER JOIN and a LEFT JOIN.
- Failed to explain the search time complexity differences between a Hash Map and a sorted Array.
- Incorrectly stated that accessing an element by index in an Array vs. Linked List 'depends upon the approach we use' instead of identifying O(1) vs. O(N) complexity.

Learning Roadmap

- Master SQL Fundamentals: Deeply study relational database design, including normalization, constraints (Primary, Unique, Foreign keys, NULL behaviors), and relational operations (INNER, LEFT, RIGHT, and FULL JOINS).
- Study Big-O Complexity and Data Structures: Revisit foundational computer science concepts to understand search, insertion, and deletion time complexities for basic structures like Arrays, Linked Lists, Hash Maps, and Binary Search Trees.
- Understand Python Internals: Study how Python dictionaries are implemented under the hood (hash tables) and learn why hashability and immutability are required for dictionary keys.
- Practice Interview Resilience: Engage in mock behavioral and technical interviews to build confidence, practice talking through solutions aloud, and learn how to navigate situations when you do not immediately know the answer instead of giving up.

Competency Report

Introduction

Weak

Provided a highly repetitive and minimal introduction without explaining his background, interests, or motivation for applying to the Backend Developer role.

Projects

Weak

Struggled to clearly define entity relationships or explain the design choices behind the database schema of his flight prediction system.

Technical

Weak

Demonstrated rudimentary Python knowledge, but failed to answer essential database constraint questions, basic SQL JOIN concepts, and foundational DSA time-complexity queries.

Overall Feedback

Hassan demonstrated a basic entry-level understanding of Python data structures (lists and tuples) and their mutability characteristics. However, his technical depth in databases and data structures is severely limited for a Backend Developer role, as he struggled with SQL constraints, joins, and basic algorithmic complexity. His communication was extremely minimal and repetitive, and he was unable to articulate the architectural choices of his own projects. Most critically, Hassan showed a substantial deficit in professional resilience, abruptly quitting the interview when challenged. He is currently not ready for a professional backend engineering position and requires significant technical and professional preparation.
